2 RELATED WORK

Introduction goes here.

3 ARCHITECTURE

The architecture of the UAV based SDN system for wireless sensor networks.

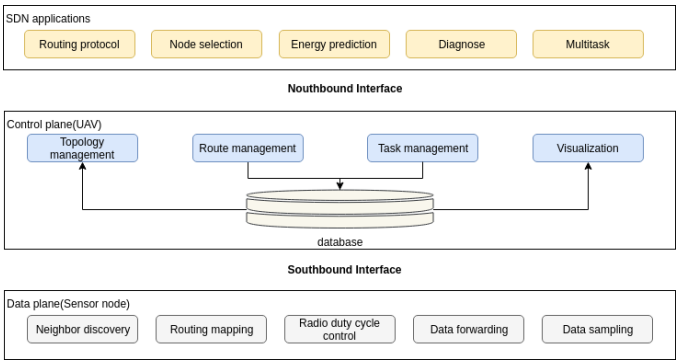

Figure 1: Architecture of the system.

Listing 1: An example of deploy routing algorithm

```
topology = get_topology();
//calculate routetable for each node
//based on topology
for(node in nodeset){
        node.routetable =
                calculate_route(topology);
}
//set route for each node
for(node in nodeset){
        UAV fly to node;
        for(route in node.routeTable)
                set_route(route);
}
```

4 APPLICATIONS

Design the following applications and provide APIs to users.

4.1 Routing

4.2 AI Node Selection

simple selection.

SRSSS AI algorithm selection.

$$
\begin{aligned}
&(\mathbf{W}_{k+1}, \mathbf{z}_{k+1}) = \\
&\arg\min_{\mathbf{W},\mathbf{z}} \sum_{i=1}^{k} \mu^{k-i} \|\mathbf{X}_k^i \mathbf{D}_\mathbf{z} \mathbf{W}(\mathbf{I} - \mathbf{D}_\mathbf{z}) - \mathbf{X}_k^i(\mathbf{I} - \mathbf{D}_\mathbf{z})\|_2^2 \\
&+ \alpha \sum_{i,j=1}^{n} \|\mathbf{y}_i - \mathbf{y}_j\|_2 |W_{ij}| - \beta \sum_{i,j=1}^{n} \|\mathbf{y}_i - \mathbf{y}_j\|_2 z_i z_j + \lambda \|\mathbf{W}\|_F^2 \\
&s.t.\ \mathbf{z} = [z_1, \ldots, z_n] \in \{0,1\}^n, \mathbf{c}^T \mathbf{z} \leq P \qquad (1)
\end{aligned}
$$

****

AI helps creating smarter sensor systems.

AI systems have been improving, and new advances in machine intelligence are creating seamless interactions between people and digital sensor systems.

In sensor systems, applications can be found for a variety of tasks, including selection of sensor inputs, interpreting signals, condition monitoring, fault diagnosis, machine and process control, machine design, process planning, production scheduling, and system configuring. Some examples of specific tasks undertaken by expert systems are: * Assembly * Automatic programming * Controlling intelligent complex vehicles * Planning inspection * Predicting risk of disease * Selecting tools and machining strategies * Sequence planning * Controlling plant growth.

AI can increase effective communication, reduce mistakes, minimize errors, and extend sensor life.

The tools and methods described have minimal computation complexity and can be implemented on small assembly lines, single robots, or systems with low-capability microcontrollers. These novel approaches proposed use ambient intelligence and the mixing of different AI tools in an effort to use the best of each technology. The concepts are generically applicable across many processes.

minimum energy, data loss, reliability, robustness, etc., in place during the design and operation of wireless sensor networks

a specific set of protocols for medium access, localization and positioning, time synchronization, topology control, security and routing are identified based on the current configuration of the network, the requirements of the application and the topology of their deployment.

4.3 AI Energy Prediction

4.4 Multi-tasks

Sensors are assigned tasks to monitor a specific area.

Different tasks have different requirements, including time, density, etc.

Table 1: System API

Structure && Function	Description
Sensor Control Interface	
struct node	Sensor node structure
struct nodeset	A set of sensor nodes
struct neighbor_list	Neighbor infomation
struct energy_item	Energy statistic information
struct routing_table	Routing table
struct duty_cycle_table	Duty cycle control table
struct sensor_enable_table	All the nodes's states. Node state: {on,off}
switch_node(node,state)	Turn on or turn off the node
get_node_info(node)	Get node's information, including node's position, duty cycle, power, etc.
set_node_attr(node,attrTag,value)	Set node attribute, including duty cycle, radio strength, etc.
get_neighborlist(node)	Get the neighbor list of a node
UAV Application Interface	
Routing	
get_topology()	Get the topology of the network
get_route(node)	Get the routing table of a node
set_route(route_table,node)	Set the routing table of a node
AI Node selection	
nodeset simple_selection(nodeset)	Select sensor set by location information
nodeset SRSSS_selection(dataset)	Select sensor set by AI algorithm based on sensing data
AI Energy Prediction	
model_selsct(modeltype)	Select an AI model
model.train(dataset,ratio)	Train an AI model with learning ratio on the data set
model.test(dataset)	Test the AI model on the data set
model.predict(node)	Do the energy prediction for a node
Multi-tasks	
create_scheduler()	Create a task scheduler
scheduler.create_buffer()	Create a task buffer
scheduler.task_buffer_add(task,nodenum)	Add a new task to task buffer
scheduler.task_schedule()	Schedule the tasks in the buffer
Diagnosis	
detect()	Detect problematic region with probes
get_topical_topology(nodeset)	Construct topical topology
diagnose_network(topology,nodeset)	Diagnose the failure nodes or lossy links

Task scheduler do the arrangement.
Task buffer.
Task queue.
Scheduling table.
...

4.5 Diagnosis

Diagnose the network.

5 IMPLEMENTATION
